Alloy type

WB36 is a NiMo base material with Cu and Nb additions with good hot strength. Although consumables of matching composition are not used compatible alternatives have been found to provide the required properties.

Materials to be welded

The consumables listed on this data sheet can be used for a wide variety of applications (see also data sheets A-50, A-61 and A-64) but this data sheet concentrates on the welding of:

| | |
|----------------------|-------------------------------|
| DIN | 15NiCuMoNb5 |
| | 1.6368 |
| BS EN 10216-2 | 15NiCuMoNb5-6-4 |
| | 1.6368 |
| BS 3604 | Grade 591 |
| ASTM | Code Case 2353 |
| | A182 F36, A213 T36 & A335 P36 |
| Proprietary | WB36 (V+M) |

Applications

WB36 is a high temperature construction steel for service up to 450°C; typical applications are below 400°C designed on the basis of tensile rather than creep properties. It is mainly used for **feedwater piping systems** in place of standard carbon steels (eg.A106 grade C) in conventional and nuclear power stations. WB36 also finds applications for **headers, manifolds** and **fittings** in power stations.

Microstructure

In the stress relieved condition the microstructure consists of tempered ferrite/bainite.

Welding guidelines

The actual preheat and PWHT requirements will depend on the thickness of the base material being welded. Normally preheat/interpass temperatures will be in the range 100-250°C depending on wall thickness.

PWHT

WB36 is tempered during manufacture in the temperature range 580-680°C, depending on specifications and requirements and following welding PWHT is required for WB36. The PWHT requirements will depend on a number of factors but will normally be about 590±30°C.

Additional information

There is a Technical Profile P36 and the related welding consumables.

For **offshore oil well-head process pipework** and **fittings**, after PWHT these low nickel consumables satisfy NACE MR0175 requirements (<1%Ni & <22HRC) intended to ensure resistance to sulphide-induced stress corrosion cracking in sour service, combined with good sub-zero toughness.

Also find applications for the repair of medium strength low alloy steel castings where a stress-relief only (rather than N+T) is to be applied.

Products available

1NiMo.B

All-positional NiMo low alloy steel MMA electrode

| Product description | MMA electrode with a basic flux coating on high purity mild steel core wire. Moisture resistant coating provides very low weld metal hydrogen levels. Recovery is about 120% with respect to core wire, 65% with respect to whole electrode. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| Storage | 3 hermetically sealed ring-pull metal tins per carton, with unlimited shelf life. Direct use from tin will give hydrogen < 5ml/100g for longer than a working shift of 8h. For electrodes that have been exposed: Redry 250 – 300°C/1-2h to ensure H ₂ < 10ml/100g, 300 – 350°C/1-2h to ensure H ₂ < 5ml/100g. Maximum 420°C, 3 cycles, 10h total. Storage of redried electrodes at 50 – 150°C in holding oven or heated quiver: no limit, but maximum 6 weeks recommended. Recommended ambient storage conditions for opened tins (using plastic lid): < 60% RH, > 18°C. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| * Minimum as-welded values are for AWS ER80S-D2 . As shown MAG welds using more oxidising shielding gas (higher CO ₂ + O ₂) have lower strength. The AWS classification for ER80S-D2 is based on 100%CO ₂ which is seldom used; alternatively this wire can also be classified as ER90S-D2 using low CO ₂ gas mixtures. | | | | | | | | |
